

CLAIMS

I claim:

1. A handheld pet animal bathing utensil which can be connected to a pressurized water supply for delivering a plurality of streams of flowing water to the base of an animal's fur coat and therefore it's skin in order to displace the entrapped air that creates the animal's natural layer of insulation.
2. A pet animal bathing utensil according to claim 1 that incorporates a nozzle consisting of an array of rigid tubular extensions extending from the utensil and terminating in a common plane or arc that are in communication with the water supply that facilitate the application of water to the base of the animal's fur coat.
3. A pet animal bathing utensil according to claim 1 that incorporates a nozzle consisting of an array of rigid tubular extensions that are of sufficient length to penetrate an animal's fur coat in order to deliver water to the base of said fur coat.
4. A pet animal bathing utensil according to claim 1 that incorporates a nozzle consisting of rigid tubular extensions that are spaced so as to be easily drawn through an animals fur coat without becoming entangled and whereby the saturating flow pattern from each rigid tubular extension will overlap the flow pattern from it's adjacent members.
5. A pet animal bathing utensil according to claim 1 that incorporates a proportional flow regulating valve.
